

MobileGo's Token BuyBack Plan

As stated in the whitepaper, MobileGo plans to use 10% of the profits generated through the mobile gaming store to buy back MobileGo tokens. Currently the plan is to have this buyback occur quarterly. As time goes by and if profits increase, we may increase the interval to a month to month basis.

Since MobileGo is a dual blockchain token, some MobileGo tokens will be Ethereum blockchain tokens and some MobileGo tokens will be Waves blockchain tokens. Therefore it is our intention to buy back tokens on both the Waves decentralized marketplace called Tidex and on at least one Ethereum decentralized marketplace like Cryptoderivatives.market.

In this way, both sets of token holders will have an equal opportunity to have tokens bought back without having to swap their assets from one blockchain to another.

Buy backs will not occur on public exchanges because there is no way to fairly allocate buy backs assuming MobileGo tokens are on multiple exchanges at that time.

Buy backs will be set at the average current market BID price for MobileGo. Therefore, buy backs will be very much like a buy wall, allowing token holders to sell into it at the current market price. For example, if the mobile store's quarterly profit is \$1 million, then ten percent or \$100k would be used for buying back tokens. Buy walls equal to \$100k would be placed at the current market price.

All MobileGo tokens that are bought back in this fashion will be burnt and destroyed. In this way, the supply of MobileGo tokens will decrease and MobileGo will become more scarce as time goes by.
